▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

$$\frac{1}{a.p \xrightarrow{a} p} (act)$$

$$\frac{p \xrightarrow{a} p'}{p + q \xrightarrow{a} p'} (sum - l) \qquad \frac{q \xrightarrow{a} q'}{p + q \xrightarrow{a} q'} (sum - r)$$

$$\frac{p \stackrel{a}{\rightarrow} p'}{p \mid q \stackrel{a}{\rightarrow} p' \mid q} (par - l) \qquad \frac{q \stackrel{a}{\rightarrow} q'}{p \mid q \stackrel{a}{\rightarrow} p \mid q'} (par - r)$$

$$\frac{p \stackrel{a}{\rightarrow} p'}{p \mid q \stackrel{a}{\rightarrow} p' \mid q'} (react) \qquad \frac{p \stackrel{a}{\rightarrow} p'}{p \setminus \{k\} \stackrel{a}{\rightarrow} p' \setminus \{k\}} (res) \text{ (if } a \notin \{k, \overline{k}\})$$

$$\frac{p \stackrel{a}{\rightarrow} p'}{p[f] \stackrel{f(a)}{\longrightarrow} p'[f]} (rel) \text{ (f relabelling function)}$$

$$\frac{p \stackrel{a}{\rightarrow} p'}{k \stackrel{a}{\rightarrow} p'} (con) \quad k = d^{f} p$$

These rules define a LTS

$$\{ \xrightarrow{a} \subseteq \mathbb{P} \times \mathbb{P} | a \in Act \}$$

Relation \xrightarrow{a} is defined inductively over process structure entailing a semantic description which is

Structural *i.e.*, each process shape (defined by the most external combinator) has a type of transitions

Modular *i.e.*, a process transition is defined from transitions in its sup-processes

Complete *i.e.*, all possible transitions are infered from these rules

Two-level semantics

- **behavioural** given by transition rules which express how system's components interact (as seen in the last classes)
- arquitectural, expresses a notion of similar assembly configurations and is expressed through a structural congruence relation;

Structural congruence

- \equiv over $\mathbb P$ is given by the closure of the following conditions:
 - for all $A(\vec{x}) = {}^{df} E_A$, $A(\vec{y}) \equiv \{\vec{y}/\vec{x}\} E_A$, (*i.e.*, folding/unfolding preserve \equiv)
 - α-conversion (*i.e.*, replacement of bounded variables).
 - both | and + originate, with ${f 0}$, abelian monoids
 - forall $a \notin \operatorname{fn}(P)$ $(P \mid Q) \setminus \{a\} \equiv P \mid Q \setminus \{a\}$
 - $\mathbf{0} \setminus \{a\} \equiv \mathbf{0}$

Compatibility

・ロト・日本・モト・モート ヨー うへで

Lemma

Structural congruence preserves transitions:

if $p \xrightarrow{a} p'$ and $p \equiv q$ there exists a process q' such that $q \xrightarrow{a} q'$ and $p' \equiv q'$.

Processes are 'prototypical' transition systems

... hence all definitions apply:

 $E \sim F$

- Processes *E*, *F* are bisimilar if there exist a bisimulation *S* st $\{\langle E, F \rangle\} \in S$.
- A binary relation S in \mathbb{P} is a (strict) bisimulation iff, whenever $(E, F) \in S$ and $a \in Act$,

i)
$$E \xrightarrow{a} E' \Rightarrow F \xrightarrow{a} F'$$
 and $(E', F') \in S$
ii) $F \xrightarrow{a} F' \Rightarrow E \xrightarrow{a} E'$ and $(E', F') \in S$

Alternative characterization of bisimilarity

Recalling bisimilarity definition:

 $\sim = \bigcup \{ S \subseteq \mathbb{P} \times \mathbb{P} \mid S \text{ is a (strict) bisimulation} \}$

・ロト・日本・モト・モート ヨー うへで

Alternative characterization of bisimilarity

Recalling bisimilarity definition:

 $\sim = \bigcup \{ S \subseteq \mathbb{P} \times \mathbb{P} \mid S \text{ is a (strict) bisimulation} \}$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへで

Usefull Lemma: $E \sim F$ iff

i)
$$E \xrightarrow{a} E' \Rightarrow F \xrightarrow{a} F'$$
 and $E' \sim F'$
ii) $F \xrightarrow{a} F' \Rightarrow E \xrightarrow{a} E'$ and $E' \sim F'$

Processes are 'prototypical' transition systems

Example: $S \sim M$

$$T = {}^{df} i.\overline{k}.T$$
$$R = {}^{df} k.j.R$$
$$S = {}^{df} (T \mid R) \setminus \{k\}$$

$$M = {}^{df} i.\tau.N$$
$$N = {}^{df} j.i.\tau.N + i.j.\tau.N$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

Processes are 'prototypical' transition systems

Example: $S \sim M$

$$T = {}^{df} i.\overline{k}.T$$
$$R = {}^{df} k.j.R$$
$$S = {}^{df} (T \mid R) \setminus \{k\}$$

$$M = {}^{df} i.\tau.N$$
$$N = {}^{df} j.i.\tau.N + i.j.\tau.N$$

through bisimulation

$$R = \{ \langle S, M \rangle \rangle, \langle (\overline{k}.T \mid R) \setminus \{k\}, \tau.N \rangle, \langle (T \mid j.R) \setminus \{k\}, N \rangle, \\ \langle (\overline{k}.T \mid j.R) \setminus \{k\}, j.\tau.N \rangle \}$$

A semaphore

Sem = df get.put.Sem

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 のへぐ

A semaphore

n-semaphores

$$Sem_{n} = {}^{df} Sem_{n,0}$$

$$Sem_{n,0} = {}^{df} get.Sem_{n,1}$$

$$Sem_{n,i} = {}^{df} get.Sem_{n,i+1} + put.Sem_{n,i-1}$$

$$(for \ 0 < i < n)$$

$$Sem_{n,n} = {}^{df} put.Sem_{n,n-1}$$

A semaphore

n-semaphores

$$Sem_{n} = {}^{df} Sem_{n,0}$$

$$Sem_{n,0} = {}^{df} get.Sem_{n,1}$$

$$Sem_{n,i} = {}^{df} get.Sem_{n,i+1} + put.Sem_{n,i-1}$$

$$(for \ 0 < i < n)$$

$$Sem_{n,n} = {}^{df} put.Sem_{n,n-1}$$

 Sem_n can also be implemented by the parallel composition of n Sem processes:

$$Sem^n = {}^{df} Sem \mid Sem \mid ... \mid Sem$$

congruence is the name of modularity in Mathematics

• process combinators preserve \sim

Lemma Assume $E \sim F$. Then,

 $a.E \sim a.F$ $E + P \sim F + P$ $E \mid P \sim F \mid P$ $E \setminus K \sim F \setminus K$ $E[f] \sim F[f]$

• recursive definition preserves \sim

$$\sim$$
 is a congruence

• First \sim is extended to processes with variables:

$$E \sim F \equiv \forall_{\tilde{P}} . E[\tilde{P}/\tilde{X}] \sim F[\tilde{P}/\tilde{X}]$$

• Then prove:

Lemma

- i) $\tilde{P} = {}^{df} \tilde{E} \implies \tilde{P} \sim \tilde{E}$ where \tilde{E} is a family of process expressions and \tilde{P} a family of process identifiers.
- ii) Let $\tilde{E} \sim \tilde{F}$, where \tilde{E} and \tilde{F} are families of recursive process expressions over a family of process variables \tilde{X} , and define:

$$ilde{A} = {}^{df} ilde{E}[ilde{A}/ ilde{X}]$$
 and $ilde{B} = {}^{df} ilde{F}[ilde{B}/ ilde{X}]$

Then

$$ilde{A} \sim ilde{B}$$

(日) (日) (日) (日) (日) (日) (日) (日)

The expansion theorem

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Every process is equivalent to the sum of its derivatives

$$E \sim \sum \{a.E' \mid E \xrightarrow{a} E'\}$$

The expansion theorem

The usual definition (based on the concurrent canonical form):

$$E \sim \sum \{ f_i(a) \cdot (E_1[f_1] \mid \dots \mid E'_i[f_i] \mid \dots \mid E_n[f_n]) \setminus K \mid$$

$$E_i \xrightarrow{a} E'_i \text{ and } f_i(a) \notin K \cup \overline{K} \}$$

$$+ \sum \{ \tau \cdot (E_1[f_1] \mid \dots \mid E'_i[f_i] \mid \dots \mid E'_j[f_j] \mid \dots \mid E_n[f_n]) \setminus K \mid$$

$$E_i \xrightarrow{a} E'_i \text{ and } E_j \xrightarrow{b} E'_j \text{ and } f_i(a) = \overline{f_j(b)} \}$$

for $E = {}^{df} (E_1[f_1] \mid ... \mid E_n[f_n]) \setminus K$, with $n \ge 1$

The expansion theorem

Corollary (for n = 1 and $f_1 = id$)

$$(E+F) \setminus K \sim E \setminus K + F \setminus K$$
$$(a.E) \setminus K \sim \begin{cases} \mathbf{0} & \text{if } a \in (K \cup \overline{K}) \\ a.(E \setminus K) & \text{otherwise} \end{cases}$$

Revisit the example and show $S \sim M$ using the expansion theorem

$$T = {}^{df} i.\overline{k}.T$$
$$R = {}^{df} k.j.R$$
$$S = {}^{df} (T \mid R) \setminus \{k\}$$

$$M = {}^{df} i.\tau.N$$
$$N = {}^{df} j.i.\tau.N + i.j.\tau.N$$

$S \sim M$

<ロ> <畳> <差> <差> <差> < 差 のへの

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

$S \sim M$ $S \sim (T \mid R) \setminus \{k\}$ $\sim i.(\overline{k}.T \mid R) \setminus \{k\}$ $\sim i.\tau.(T \mid j.R) \setminus \{k\}$ $\sim i.\tau.(i.(\overline{k}.T \mid j.R) \setminus \{k\} + j.(T \mid R) \setminus \{k\})$ $\sim i.\tau.(i.j.(\overline{k}.T \mid R) \setminus \{k\} + j.i.(\overline{k}.T \mid R) \setminus \{k\})$ $\sim i.\tau.(i.j.\tau.(T \mid j.R) \setminus \{k\} + j.i.\tau.(T \mid j.R) \setminus \{k\})$

$$S \sim M$$

$$S \sim (T \mid R) \setminus \{k\}$$

$$\sim i.(\overline{k}.T \mid R) \setminus \{k\}$$

$$\sim i.\tau.(T \mid j.R) \setminus \{k\}$$

$$\sim i.\tau.(i.(\overline{k}.T \mid j.R) \setminus \{k\} + j.(T \mid R) \setminus \{k\})$$

$$\sim i.\tau.(i.j.(\overline{k}.T \mid R) \setminus \{k\} + j.i.(\overline{k}.T \mid R) \setminus \{k\})$$

$$\sim i.\tau.(i.j.\tau.(T \mid j.R) \setminus \{k\} + j.i.\tau.(T \mid j.R) \setminus \{k\})$$
Let $N' = (T \mid j.R) \setminus \{k\}$.

This expands into $N' \sim i.j.\tau. (T \mid j.R) \setminus \{k\} + j.i.\tau.(T \mid j.R) \setminus \{k\}$, Therefore $N' \sim N$ and $S \sim i.\tau.N \sim M$

• requires result on unique solutions for recursive process equations

Exercise

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Using the expansion theorem, reduce ${\cal P}$ and ${\cal Q}$ into its concurrent normal form

$$P_{1} = {}^{df} a.P'_{1} + b.P''_{2}$$

$$P_{2} = {}^{df} \overline{a}.P'_{2} + c.P''_{2}$$

$$P_{3} = {}^{df} \overline{a}.P'_{3} + \overline{c}.P''_{3}$$

$$P = {}^{df} (P_{1} | P_{2}) \setminus \{a\}$$

$$Q = {}^{df} (P_{1} | P_{2} | P_{3}) \setminus \{a, b\}$$

Observable transitions

$$\stackrel{a}{\Rightarrow} \subseteq \mathbb{P} \times \mathbb{P}$$

- $L \cup \{\epsilon\}$
- A [€]⇒-transition corresponds to zero or more non observable transitions
- inference rules for $\stackrel{a}{\Rightarrow}$:

$$\frac{1}{E \stackrel{\epsilon}{\Rightarrow} E} (O_1)$$

$$\frac{E \xrightarrow{\tau} E' \quad E' \xrightarrow{\epsilon} F}{E \xrightarrow{\epsilon} F} (O_2)$$

$$\frac{E \stackrel{\epsilon}{\Rightarrow} E' \quad E' \stackrel{a}{\to} F' \quad F' \stackrel{\epsilon}{\Rightarrow} F}{E \stackrel{a}{\Rightarrow} F} (O_3) \quad \text{for } a \in L$$

Consider

$$Sem = {}^{df} get.put.Sem$$

$$P_1 = {}^{df} \overline{get.c_1}.\overline{put.P_1}$$

$$P_2 = {}^{df} \overline{get.c_2}.\overline{put.P_2}$$

$$S = {}^{df} (Sem \mid P_1 \mid P_2) \setminus \{get, put\}$$

and

$$S' =^{df} \tau . c_1 . S' + \tau . c_2 . S'$$

in order to prove S = S':

Consider

$$Sem = {}^{df} get.put.Sem$$

$$P_1 = {}^{df} \overline{get.}c_1.\overline{put.}P_1$$

$$P_2 = {}^{df} \overline{get.}c_2.\overline{put.}P_2$$

$$S = {}^{df} (Sem \mid P_1 \mid P_2) \setminus \{get, put\}$$

and

$$S' = {}^{df} \tau . c_1 . S' + \tau . c_2 . S'$$

in order to prove S = S': it is enough to show that both are solutions of

$$X = \tau . c_1 . X + \tau . c_2 . X$$

▲ロト ▲帰ト ▲ヨト ▲ヨト 三日 - の々ぐ

Then:

- $S = \tau. (c_1.\overline{put}.P_1 | P_2 | put.Sem) \setminus K + \tau.(P_1 | c_2.\overline{put}.P_2 | put.Sem) \setminus K$ = $\tau.c_1. (\overline{put}.P_1 | P_2 | put.Sem) \setminus K + \tau.c_2.(P_1 | \overline{put}.P_2 | put.Sem) \setminus K$ = $\tau.c_1.\tau. (P_1 | P_2 | Sem) \setminus K + \tau.c_2.\tau.(P_1 | P_2 | Sem) \setminus K$ = $\tau.c_1.\tau.S + \tau.c_2.\tau.S$ = $\tau.c_1.S + \tau.c_2.S$
 - $= \{S/X\}E$

Then:

 $S = \tau. (c_1.\overline{put}.P_1 | P_2 | put.Sem) \setminus K + \tau.(P_1 | c_2.\overline{put}.P_2 | put.Sem) \setminus K$ = $\tau.c_1. (\overline{put}.P_1 | P_2 | put.Sem) \setminus K + \tau.c_2.(P_1 | \overline{put}.P_2 | put.Sem) \setminus K$ = $\tau.c_1.\tau. (P_1 | P_2 | Sem) \setminus K + \tau.c_2.\tau.(P_1 | P_2 | Sem) \setminus K$ = $\tau.c_1.\tau.S + \tau.c_2.\tau.S$ = $\tau.c_1.S + \tau.c_2.S$ = $\{S/X\}E$

for S' is immediate

Consider,

$$B = {}^{df} in.B_1$$
$$B_1 = {}^{df} in.B_2 + \overline{out}.B_1$$
$$B_2 = {}^{df} \overline{out}.B_1$$

$$B' = {}^{df} (C_1 | C_2) \setminus m$$
$$C_1 = {}^{df} in.\overline{m}.C_1$$
$$C_2 = {}^{df} m.\overline{out}.C_2$$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Consider,

$$B = {}^{df} in.B_1 \qquad B' = {}^{df} (C_1 | C_2) \setminus m$$

$$B_1 = {}^{df} in.B_2 + \overline{out}.B \qquad C_1 = {}^{df} in.\overline{m}.C_1$$

$$B_2 = {}^{df} \overline{out}.B_1 \qquad C_2 = {}^{df} m.\overline{out}.C_2$$

B is a solution of

$$X = E(X, Y, Z) = in.Y$$

$$Y = E_1(X, Y, Z) = in.Z + \overline{out.X}$$

$$Z = E_3(X, Y, Z) = \overline{out.Y}$$

through $\sigma = \{B/X, B_1/Y, B_2/Z\}$

To prove $\mathbf{B} = \mathbf{B}'$

$$B' = (C_1 | C_2) \setminus m$$

= $in.(\overline{m}.C_1 | C_2) \setminus m$
= $in.\tau.(C_1 | \overline{out}.C_2) \setminus m$
= $in.(C_1 | \overline{out}.C_2) \setminus m$

Let $S_1 = (C_1 \mid \overline{out}.C_2) \setminus m$ to proceed:

$$S_{1} = (C_{1} | \overline{out}.C_{2}) \setminus m$$

= in. ($\overline{m}.C_{1} | \overline{out}.C_{2}$) \ m + $\overline{out}.(C_{1} | C_{2}) \setminus m$
= in. ($\overline{m}.C_{1} | \overline{out}.C_{2}$) \ m + $\overline{out}.B'$

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Finally, let, $S_2 = (\overline{m}.C_1 \mid \overline{out}.C_2) \setminus m$. Then,

$$S_{2} = (\overline{m}.C_{1} \mid \overline{out}.C_{2}) \setminus m$$

= $\overline{out}.(\overline{m}.C_{1} \mid C_{2}) \setminus m$
= $\overline{out}.\tau.(C_{1} \mid \overline{out}.C_{2}) \setminus m$
= $\overline{out}.\tau.S_{1}$
= $\overline{out}.S_{1}$

Note the same problem can be solved with a system of 2 equations:

$$X = E(X, Y) = in.Y$$

$$Y = E'(X, Y) = in.\overline{out}.Y + \overline{out}.in.Y$$

Clearly, by substitution,

$$B = in.B_1$$

$$B_1 = in.\overline{out}.B_1 + \overline{out}.in.B_1$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

On the other hand, it's already proved that $B' = \ldots = in.S_1$. so,

$$S_{1} = (C_{1} | \overline{out}.C_{2}) \setminus m$$

= $in.(\overline{m}.C_{1} | \overline{out}.C_{2}) \setminus m + \overline{out}.B'$
= $in.\overline{out}.(\overline{m}.C_{1} | C_{2}) \setminus m + \overline{out}.B'$
= $in.\overline{out}.\tau.(C_{1} | \overline{out}.C_{2}) \setminus m + \overline{out}.B'$
= $in.\overline{out}.\tau.S_{1} + \overline{out}.B'$
= $in.\overline{out}.S_{1} + \overline{out}.B'$
= $in.\overline{out}.S_{1} + \overline{out}.in.S_{1}$

Hence, $B' = \{B'/X, S_1/Y\}E$ and $S_1 = \{B'/X, S_1/Y\}E'$

Suppose two variants of parallel composition have been added to the process language \mathbb{P} and defined through the following rules:

$$\frac{E \xrightarrow{a} E'}{E \otimes F \xrightarrow{a} E' \otimes F} (O_1) \qquad \qquad \frac{F \xrightarrow{a} F'}{E \otimes F \xrightarrow{a} E \otimes F'} (O_2)$$

$$\frac{E \xrightarrow{a} E' \text{ and } \overline{a} \notin \mathcal{L}(F)}{E \parallel F \xrightarrow{a} E' \parallel F} (P_1) \qquad \qquad \frac{F \xrightarrow{a} F' \text{ and } \overline{a} \notin \mathcal{L}(E)}{E \parallel F \xrightarrow{a} E \parallel F'} (P_2)$$

$$\frac{E \xrightarrow{a} E' F \xrightarrow{\overline{a}} F'}{E \parallel F \xrightarrow{\tau} E' \parallel F'} (P_3)$$

< □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > <

1 Explain, in your own words, the meaning of $\otimes e \parallel$.

- 2 prove or refute:
 - \otimes is associative with respect to \sim

Consider the following statements about a binary relation S on \mathbb{P} . Discuss whether you may conclude from each of them whether S is (or is not) a weak bisimulation:

- **1** S is the identity in \mathbb{P} .
- **2** S is a subset of the identity in \mathbb{P} .
- **3** S is a strict bisimulation up to \equiv .
- **4** S is the empty relation.

$$S = \{(a.E, a.F) \mid E \approx F\}.$$

$$S = \{(a.E, a.F) \mid E \approx F\} \cup \approx.$$

Suppose processes R and T have transitions $R \xrightarrow{\tau} T$ and $T \xrightarrow{\tau} R$, among others. Show that, under this condition, R = T.

Identify, in the list of process pairs below, which of them can be related by $\approx \!\!\!\!\!\!\!\!\!\!\!\!$ And by =?

Consider the following specification of a *pipe*, as supported e.g. in UNIX:

$$U \rhd V =^{abv} (U[c/out] | V[c/in]) \setminus \{c\}$$

under the assumption that, in both processes, actions \overline{out} e *in* stand for, respectively, the output and input ports.

1 Consider now the following processes only partially defined:

$$U_{1} = {}^{df} \overline{out}.T$$

$$V_{1} = {}^{df} \overline{in.R}$$

$$U_{2} = {}^{df} \overline{out}.\overline{out}.\overline{out}.T$$

$$V_{2} = {}^{df} \overline{in.in.R}$$

Prove, by equational reasoning, or refute the following properties:

$$\begin{array}{ccccccc} \bullet & U_1 \vartriangleright V_1 & \sim & T \vartriangleright R \\ \bullet & U_2 \vartriangleright V_2 & = & U_1 \vartriangleright V \end{array}$$

2 Show that $\mathbf{0} \succ \mathbf{0} = \mathbf{0}$.
