

Evaluation in Visualization

How can we produce a Visualization/ Visual data exploration app?

 There are principles (derived form human perception and cognition) and many visualization techniques (we study some...)

- To obtain efficacy a Human-centered approach is fundamental, involving:
 - a correct definition of goal and user tasks (the questions!)
 - apply adequate methods and evaluate
 in several iterations until the goals are satisfied

How can we evaluate?

 Many methods can be used to evaluate a Visualization application (some specifically developed, others adapted)

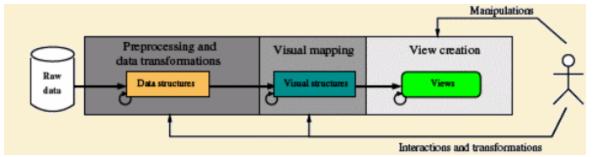

- Evaluation methods from other disciplines may and have been adapted and used to evaluate Visualization applications, as methods from:
 - Human- Computer Interaction
 - Image Processing
 - S/W Engineering

- Applications to visually explore data are interactive and should be usable
- **Usability** is, according to ISO 9241-11:

"the extent to which a product can be used by specified users to achieve specified goals with effectiveness, efficiency and satisfaction in a specified context of use"

- How to measure it??
- We can use methods used in Human-Computer Interaction

• Evaluating a visualization technique should involve evaluation of all phases:

data transformatione.g.

low level: accuracy of methods (errors, artifacts)

high level: efficacy and efficiency in supporting users tasks

- visual mapping

e.g.

high level, efficacy and efficiency in supporting users tasks

- view creation

low level: accuracy of methods (errors, artifacts)

high level: efficacy and efficiency in supporting users tasks

Cannot forget the interaction (not only visual) aspects!

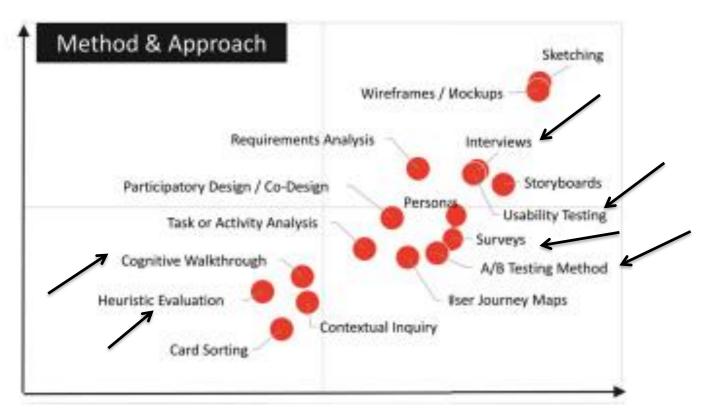

Usability evaluation Methods

 Methods used in Human-Computer Interaction to evaluate usability may be used to evaluate visualizations and visual data exploration applications and some have been adapted

Analytical (without users)
 Cognitive Walkthrough
 Model based methods
 Review methods
 ...
 Observation
 usability tests
 Query
 Controlled Experiments

Methods used by twenty data visualization practitioners: (including evaluation methods)

P. Parsons, "Understanding Data Visualization Design Practice," *IEEE Transactions on Visualization and Computer Graphics*, vol. 28, n.1, 2022 https://ieeexplore.ieee.org/document/9555646

Heuristic Evaluation (Nielsen and Molich 1990)

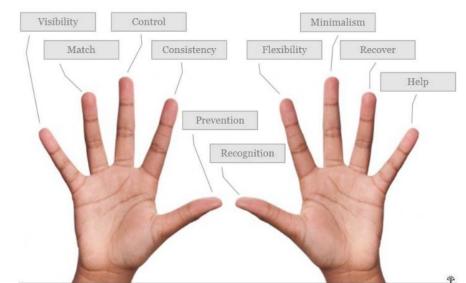

- A "discount usability engineering method" for quick, cheap, and easy evaluation of a UI design
- Most popular usability inspection method; yet is subjective
- It is a **systematic inspection** of a design for usability
- Meant to find the usability problems in the design so that they can be attended to as part of an iterative design process
- Involves a small set of analysts judging the UI against a list of usability principles ("heuristics")

How to perform HE

- Should be performed by several evaluators (one person will never be able to find all the problems)
- Evaluators should work independently:
 - First get a general idea of the UI
 - Then perform a detailed inspection using a set of heuristics
 - Listing usability problems (heuristics not followed and severity degree)
- Findings of all evaluators should be integrated in the same report
- The report should help the development teem to prioritize problem fixing

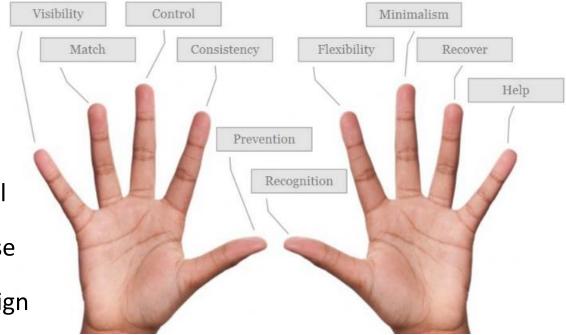

http://www.nngroup.com/articles/how-to-conduct-a-heuristic-evaluation

- Nielsen proposed **10 general usability heuristics**, yet **there are other sets** (e.g., visualization, web, mobile applications for seniors or children...)
- More details on how to conduct a heuristic evaluation at: http://www.nngroup.com/articles/how-to-conduct-a-heuristic evaluation
- And how to rate severity of the usability problems found: http://www.nngroup.com/articles/how-to-rate-the-severity-of-usability-problems/
- The list of problems and severity rates should help the development team to priorityse problem fixing

List of recognized usability principles ("the heuristics")

- 1-Visibility of system status
- 2-Match between system and the real world
- 3-User control and freedom
- 4-Consistency and standards
- 5-Error prevention
- 6-Recognition rather than recall
- 7-Flexibility and efficiency of use
- 8-Aesthetic and minimalist design
- 9-Help users recognize, diagnose, and recover from errors
- 10-Help and documentation https://www.nngroup.com/articles/ten-usability-heuristics/

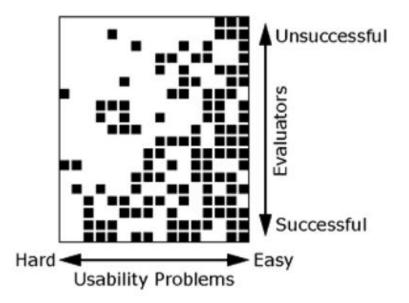

Number of problems found by several evaluators Example:

- Heuristic evaluation of a banking system:
 - 19 evaluators
 - 16 usability problems

black square - problem found white square - not found

http://www.nngroup.com/articles/how-to-conduct-a-heuristic-evaluation

- Conclusion: in general 3 to 5 evaluators seems reasonable
- More evaluators find more problems but cost more ...

Specific Heuristics for Visualization

- Zuk's Perceptual and Cognitive heuristics (Zuk et al., 2006)
- Forsell's. heuristic set for evaluation in InfoVis (Forsell and Johanson, 2010)
- Shneiderman's "Visual Information-Seeking Mantra"
- Freitas's *et al*. Ergonomic Criteria for Hierarchical Information Visualization Techniques (Freitas et al., 2009)
- Amar and Stasko's Knowledge and task-based framework

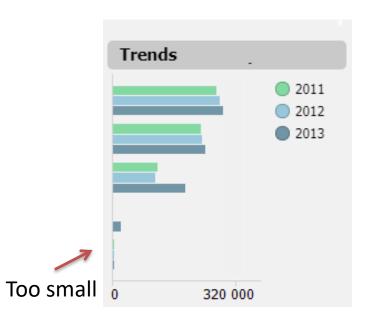

• ...

Zuk and Carpendale's (2006) heuristics

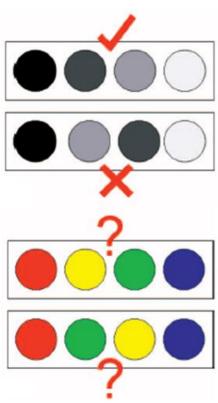

- 1-Ensure visual variable has sufficient length
- 2-Don't expect reading order from color
- 3-Color perception varies with size of colored item
- 4-Local contrast affects color & gray perception
- 5-Consider people with color blindness
- 6-Preattentive benefits increase with field of view
- 7-Quantitative assessment requires position or size variation
- 8-Preserve data to graphics dimensionality
- 9-Put the most data in the least space
- 10-Remove the extraneous (ink)
- 11-Consider Gestalt Laws
- 12-Provide multiple levels of detail
- 13-Integrate text whenever relevant

Explaining some of the Specific Heuristics for Visualization

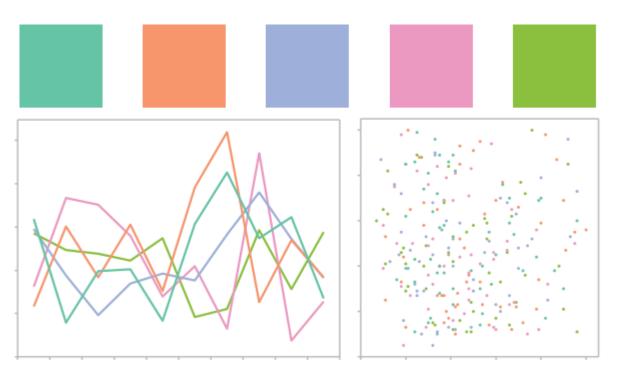

Visual variables must have sufficient length

Do not expect to easily perceive order from color

Color perception varies with size of colored item

A set of colors with different hues but equal luminance ($L^* = 72$). In the squares, these colors are distinct and visually balanced (www.colorbrewer.org).

They are harder to distinguish in smaller items

Stone, M., "In color perception, size matters", IEEE *Computer Graphics & Applications*. 32, 2, 2012, pp. 8-13

Consider people with color blindness

The most common form of color blindness is deuteranopia ("daltonism")

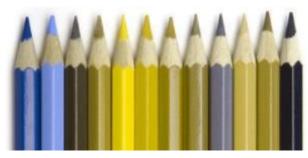

There are color blindness simulators

http://www.color-blindness.com/cobliscolor-blindness-simulator

Normal vision

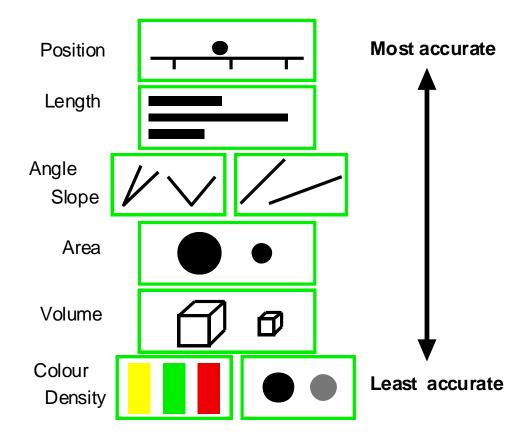

Deuteranopia

Tritanopia http://www.colourblindawareness.org/

Quantitative assessment requires position or size variation

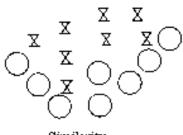

The relative difficulty of assessing quantitative value as a function of encoding mechanism, as established by Cleveland and McGill (Spence, 2007)

Gestalt Laws

Proximity

Near stimuli are perceived as a group

Similarity

Similar stimuli tend to be grouped (may override proximity)

Closure

Stimuli tend to be grouped in complete figures

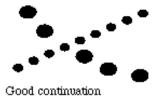

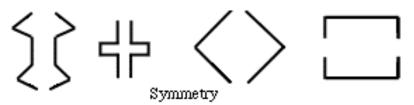

Simplicity

Ambiguous stimuli tend to be resolved Using the simplest explanation

Stimuli tend to be grouped as to minimize variations or discontinuities

Regions delimited by symmetric tend to be perceived as coherent figures

Forsell's et al. (2010) heuristics

- **B5. Information coding.** Perception of information is directly dependent on the mapping of data elements to visual objects. This should be enhanced by using realistic characteristics/techniques or the use of additional symbols.
- E7. Minimal actions. Concerns workload with respect to the number of actions necessary to accomplish a goal or a task.
- E11: Flexibility. Flexibility is reflected in the number of possible ways of achieving a given goal. It refers to the means available to customization in order to take into account working strategies, habits and task requirements.
- B7: Orientation and help. Functions like support to control levels of details, redo/undo of actions and representing additional information.
- **B3:** Spatial organization. Concerns users' orientation in the information space, the distribution of elements in the layout, precision and legibility, efficiency in space usage and distortion of visual elements.

Uses heuristics from other sets:

B- Freitas et al.

C - Nielsen

D- Zuck and Carpendale

E- Bastien & Scapin

E16: Consistency. Refers to the way design choices are maintained in similar contexts, and are different when applied to different contexts.

C6: Recognition rather than recall. The user should not have to memorize a lot of information to carry out tasks.

E1: Prompting. Refers to all means that help to know all alternatives when several actions are possible depending on the contexts

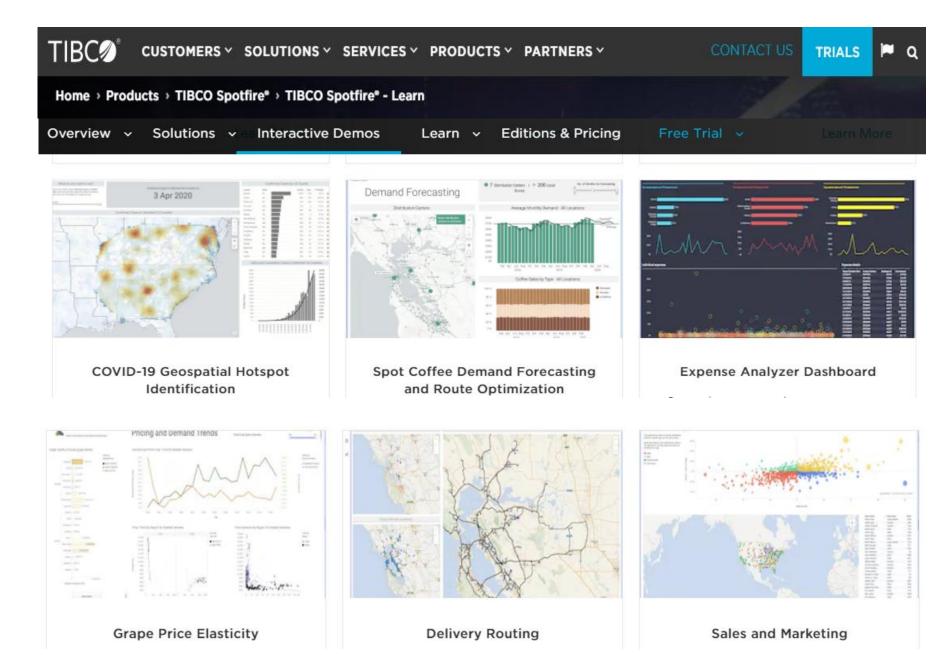

D10: Remove the extraneous. Concerns whether any extra information can be a distraction and take the eye away from seeing the data or making comparisons.

B9: Data set reduction. Concerns provided features for reducing a data set, their efficiency and ease of use

Practice using heuristic evaluation:

(groups of three students)

- Select a Visualization application from:
 - Spotfire demo gallery
 - Tableau Public
 - etc.
- Select a set of heuristics (e.g. Nielsen's or Zuch's)
- Explore and identify interesting characteristics or problems
- Perform na heuristic evaluation
- Prepare a short presentation with the most interesting results

Viz of the Day Featured

Towards Better Climate

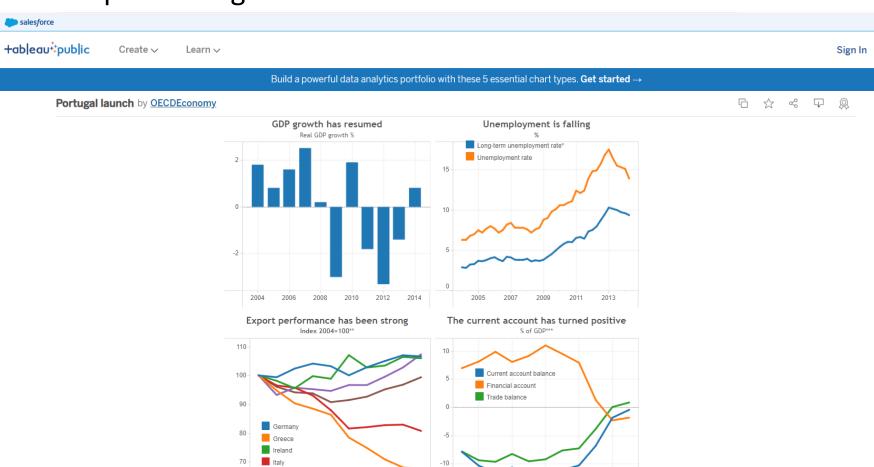

Curious what is happening with CO2 emissions across the globe and how they might be reduced? In this visualization, Nontharatt Jarnyaharn—based in the UK—explores emissions by country, contributing factors to either increasing or decreasing CO2 worldwide, and some potential solutions.

A Portuguese public example: monitoring the National Health Service (SNS)

Usability tests

- "Engineering approach"
- Involve observation and query
- Main aspects:
 - Participants
 - Tasks
 - Test facilities and systems
 - Experimental design
 - Usability measures
 - Data analysis
- May have a complex logistics

Observation

Has many variants from very simple to very complex and expensive:

• **Direct**: observer takes notes

- Indirect: through audio/ video more complex and time consuming
- Think Aloud: users are asked to explain what they are doing
- Logging: users activity is logged by the system
- Combinations of the previous, etc.

Query

Strongly

- Two main variants:
 - Questionnaire (reach more people; less flexible)
 - Interview
- Should always be carefully prepared and tested
- Collected data should be carefully analyzed

https://www.interaction-design.org/literature/article/useful-survey-questions-for-user-feedback-surveys

https://www.interaction-design.org/literature/article/how-to-conduct-user-interviews

Well-known usability questionnaires

Strongly Strongly Strongly

- System Usability Scale (SUS)
- Questionnaire for User Interface Satisfaction (QUIS)
- SUS provides a "quick and dirty", reliable tool for measuring the usability
- It includes 10 questions with five response options
- QUIS is designed to assess a user's subjective satisfaction with the UI
- It is designed to be configured according to the needs of each UI analysis by including only the sections that are of interest to the user
- Both questionnaires should be completed following use of the UI in question

System Usability Scale (SUS)

- Provides a "quick and dirty", reliable tool for measuring the usability
- It includes 10 questions with five response options
- It allows to evaluate a wide variety of products and services
 (H/W, S/W, mobile devices, websites and applications)
- Has become an industry standard, with references in over 1300 publications

Benefits of using a SUS

- Is a very easy scale to administer to participants
- Can be used on small sample sizes with reliable results
- Is valid it can differentiate between usable and unusable systems

https://www.usability.gov/how-to-and-tools/methods/system-usability-scale.html

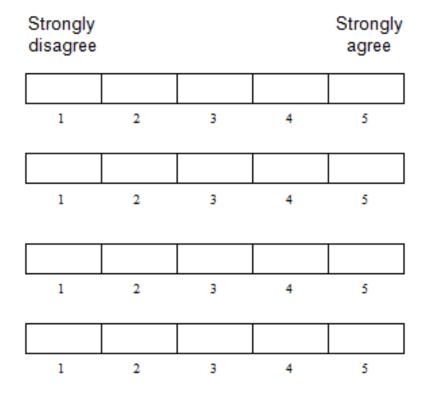

SUS Questions

- I think that I would like to use this system frequently.
- I found the system unnecessarily complex.
- I thought the system was easy to use.
- I think that I would need the support of a technical person to be able to use this system.
- I found the various functions in this system were well integrated.
- I thought there was too much inconsistency in this system.
- I would imagine that most people would learn to use this system very quickly.
- I found the system very cumbersome to use.
- I felt very confident using the system.
- I needed to learn a lot of things before I could get going with this system.

https://www.usability.gov/how-to-and-tools/resources/templates/system-usability-scale-sus.html

Scoring SUS

- I think that I would like to use this system frequently
- I found the system unnecessarily complex
- I thought the system was easy to use
- I think that I would need the support of a technical person to be able to use this system

Note that:

odd numbered questions represent positive aspects and

even numbered questions negative aspects...

Scoring SUS

- SUS provides a value in [0-100]
- To obtain the value:
 - Add the scores of all questions:
 - odd numbered questions subtracting 1 from the score
 - even numbered questions subtracting their value from 5
 - Multiply the sum by 2.5.

SUS > 68 would be considered above average

Questionnaire concerning the usability of a web application (ua.pt)

Usability test concerning a web application

0% 100%

System Usability Scale (SUS)

* Please score the following 10 items with one of five responses that range from Strongly Agree to Strongly disagree, considering that the application you have used as "the system"

	5				1
	Strongly agree	4	3	2	Strongly disaggree
I think that I would like to use this system frequently	0	0	0	0	0
I found the system unnecessarily complex.	0	0	0	0	0
I thought the system was easy to use.	0	0	0	0	0
I think that I would need the support of a technical person to be able to use this system.	0	0	0	0	0
I found the various functions in this system were well integrated.	0	0	0	0	0
I thought there was too much inconsistency in this system.	0	0	0	0	0
I would imagine that most people would learn to use this system very quickly.	0	0	0	0	0
I found the system very cumbersome to use.	0	0	0	0	0
I felt very confident using the system.	0	0	0	0	0
I needed to learn a lot of things before I could get going with this system.	0	0	0	0	0

Submit

Example of a usability test of a visual exploration app

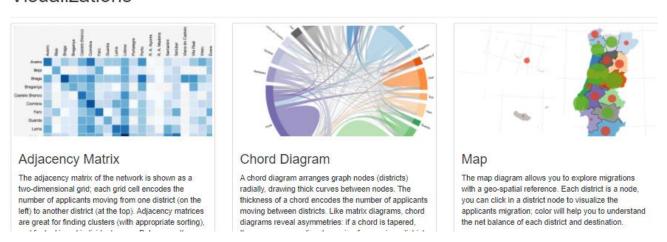

based on a web questionnaire to be answered by a user while observed by an experimenter

Data

The candidates and institutions data were provided by Direcção Geral do Ensino Superior. The data represents three years (2012, 2013 and 2014) of Portuguese students applications to universities and polytechnic institutions. The dataset has 115636 students applications from 20 districts to 305 institutions.

The geography shapes data is from Direção Geral do Território.

Visualizations

https://forms.ua.pt/index.php?r=survey/index&sid=489227

Controlled experiments

- The work horse of experimental science ...
- Important issues to consider:
 - Hypothesis
 - Variables (input or independent; output or dependent)
 - Secondary variables
 - Experimental design (within groups; between groups)
 - Participants (number, profile)
 - Statistics

Controlled experiment

- Define an hypothesis
- Define input (independent), output (dependent) and secondary variables
- Define experimental design (within-groups / between groups)
- Select the participants
- Prepare all the documentation:
 - informed consent
 - list of tasks and perceived difficulty
 - final questionnaire
 - list of tasks for the observer to take notes

Run a pilot test

Take care of the logistics ... and after the experiment analyze data

To the user

To the observer

Participants

Important issues in usability tests and controlled experiments:

- The total number of participants to be tested
 (a valid statistical analysis implies a sufficient number of subjects)
- Segmentation of user groups tested, if more than one
- Key characteristics and capabilities of user group (user profile: age, gender, computing experience, product experience, etc.)
- How to select participants
- Differences between the participant sample and the user population
 (e.g. actual users might have training whereas test subjects were untrained)

Tasks

- The task scenarios for testing (or experiments)
- Why these tasks were selected
 (e.g. the most frequent tasks, the most troublesome tasks)
- The source of these tasks
 (e.g. observation of users using similar products, product specifications)
- Any task data given to the participants
- Completion or performance criteria established for each task (e.g. n. of clicks < N, time limit)

Test Facilities and equipment

- The setting and type of space in which the evaluation will be done
 (e.g. usability lab, cubicle office, meeting room, home office, home family room, manufacturing floor, etc.)
- Any relevant features or circumstances that can affect the results
 (e.g. video and audio recording equipment, one-way mirrors, or automatic data collection equipment)
- Participant's Computing Environment

 (e.g. computer configuration, including model, OS version, required libraries or settings, browser name and version; relevant plug-in, etc.)
- Display and input devices characteristics
- Any questionnaires to be used

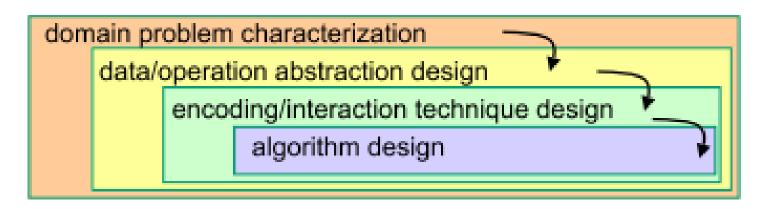

Experimental design

- Procedure/ protocol: the logical design of the test/experiment
- Participant general instructions and task instructions
- The independent variables and control variables
- The usability measures to be used:
 - a) for effectiveness (completeness rate, errors, assists...)
 - b) for efficiency (times)
 - c) for satisfaction

We know issues and methods, but how to use them?

A nested model for visualization design and validation:

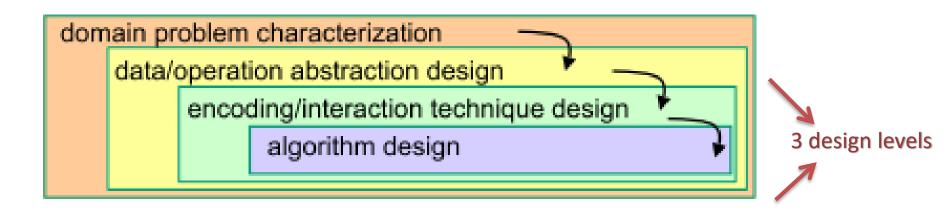

- This model can be used :
 - to analyze existing systems or papers,
 - to guide the design process
- Provides explicit guidance on what **evaluation methodology** is appropriate and identifies **threats to validity at each level**

Munzner, T.. A nested model for visualization design and validation. *IEEE Transactions on Visualization and Computer Graphics*. 15, 6, 2009, pp. 921–8

Four levels for visualization design and validation

- characterize the tasks and data in the vocabulary of the problem domain,
- abstract into operations and data types,
- design visual encoding and interaction techniques,
- create algorithms to execute these techniques with efficiency and efficacy

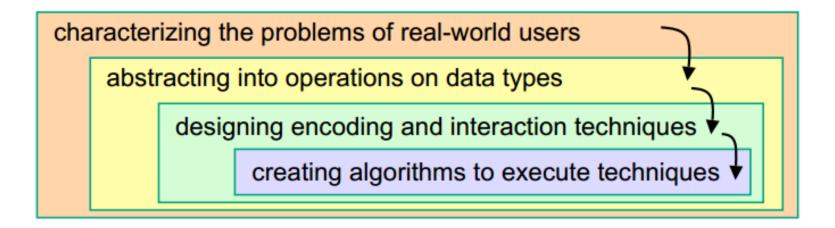

In each of the four levels it is necessary to:

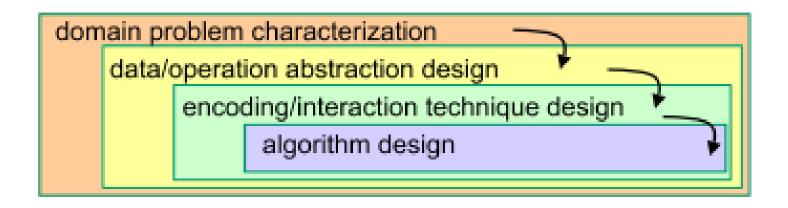

- 1- learn about the tasks and data of target users in some particular target domain,
- 2- map problems and data from the vocabulary of the specific domain into a more abstract description in the vocabulary of computer science (e.g. filter, retrieve value, sort, find extrema, etc.)
- 3- design the visual encoding, presentation and interaction,
- 4- create an algorithm to carry out the visual encoding and interaction designs automatically. The issues of algorithm design are not unique to visualization.

This split into levels is motivated by shared **threats to validity** at each one:

- Wrong problem: they don't do that;
- Wrong abstraction: you're showing them the wrong thing;
- Wrong encoding/interaction: the way you're showing the thing doesn't work;
- Wrong algorithm: your code is not adequate (e.g. too slow).

- Output from a level above is input to the level below
- An upstream error inevitably cascades to all downstream levels:
- E.g. a poor choice in the abstraction stage will not create a visualization system that solves the intended problem, even with perfect visual encoding and algorithm design.

- Evaluating Visualizations is challenging
- It will become more challenging as Visualization evolves to be more interactive, collaborative, mobile, immersive, multi-sensorial, ...
- It is fundamental to:
 - evaluate solutions to specific cases
 - develop new visualization methods / systems
 - establish guidelines
 - i.e. to make Visualization more useful, more usable, and more used
